

Dear Reader,

Recently, the concept of MDM or Mobile Device Management has become an increasing topic of interest. Why not...mobile devices are becoming more prevalent and have become a necessity for us to keep connected in our corporate and personal lives.

What does MDM mean to you?

In today's society we are becoming reliant on instant real-time access and availability of information via our laptops, tablets, rugged PDA's, smart phones and now super phones to make informed decisions and keep us connected. While these devices do provide convenience, how often do we consider the security and vulnerability implications? How does corporate IT ensure policy governance and compliance?

Introducing...MDM! Mobile Device Management tools allow organizations to remotely and securely manage, control and lock down devices while safeguarding your data, protecting your network and ensuring compliance. Some of the key compliance parameters include:

- Asset management
- Device configuration/provisioning/email/IT policies/feature controls
- Remote helpdesk/support
- Location services/GPS tracking
- Application and data management (silent or user assisted)
- Reporting and alerts

Organizations can now make the option available for personal devices to be introduced into the corporate environment. These devices are locked down and managed just as any other company issued device.

Rest assured knowing the M-LINX™ solution provides the opportunity for full device management and security controls.

As always, I welcome all questions, comments and the opportunity to discuss how MCC can assist your business.

Sincerely,

Mike
